Abstract of the Disclosure

5 A pavement rejuvenating and/or conditioning
composition in which particular coal tar derivatives and
other optional ingredients are supplemented with an
elastomeric constituent. A rejuvenating or conditioning
composition containing an elastomer will reliably hold in
place a top layer of fine aggregate, whereas a rejuvenating
or conditioning composition without elastomer does not, and
also allows for early restoration of traffic, prompt
10 resistance to rain, and good repair and wear resistance of
and in the pavement to be maintained. The elastomer is
preferably acrylonitrile-butadiene polymer although other
polymers can also be substituted including natural and
nitrile-rubbers, polyorganosiloxane and, less preferably,
15 styrene-butadiene, neoprene- and polybutadiene polymers.
